

# 15-150 Fall 2013

Stephen Brookes  
Lecture 4

Using induction

# Our plan

- Introduce induction
  - templates to help write accurately
  - learn when applicable
- Focus on *examples*
- Specifications will involve *equality* and *evaluation*

# Simple induction

- To prove a property of the form  
 $P(n)$ , for all non-negative integers  $n$
- First, prove  $P(0)$ . *base case*
- Then show that, for all  $k \geq 0$ ,  
 $P(k+1)$  follows logically from  $P(k)$ .  
*inductive step*

# Example

```
fun f(x:int):int =  
    if x=0 then 1 else f(x-1) + 1
```

```
(* REQUIRES  $x \geq 0$  *)
```

```
(* ENSURES  $f(x) = x + 1$  *)
```

- To prove:

For all values  $x:int$   
such that  $x \geq 0$ ,  $f(x) = x + 1$

# Proof by simple induction

- Let  $P(n)$  be  $f(n) = n+1$
- Base case: we prove  $P(0)$ , i.e.  $f(0) = 0+1$

$$\begin{aligned} f\ 0 &= (\text{fn } x \Rightarrow \text{if } x=0 \text{ then } 1 \text{ else } f(x-1)+1)\ 0 \\ &= \llbracket x:0 \rrbracket (\text{if } x=0 \text{ then } 1 \text{ else } f(x-1)+1) \\ &= \text{if } 0=0 \text{ then } 1 \text{ else } f(0-1) + 1 \\ &= \text{if true then } 1 \text{ else } f(0-1) + 1 \\ &= 1 \end{aligned}$$

$$0+1 = 1$$

$$\text{So } f(0) = 0+1$$

# Proof by simple induction

- Let  $P(n)$  be  $f(n) = n + 1$
- Inductive step:  
let  $k \geq 0$ , assume  $P(k)$ , prove  $P(k+1)$ .  
Let  $v$  be the value of  $k+1$ .

$$\begin{aligned} f(k+1) &= \text{if } v=0 \text{ then } 1 \text{ else } f(v-1) + 1 \\ &= \text{if false then } 1 \text{ else } f(v-1) + 1 \\ &= f(v-1) + 1 \\ &= f(k) + 1 && \text{since } v=k+1 \\ &= (k + 1) + 1 && \text{by assumption } P(k) \end{aligned}$$

So  $P(k+1)$  follows from  $P(k)$

# Using simple induction

- Q: When can I use *simple* induction to prove a property of a recursive function  $f$  ?
- A: When there is a *non-negative* measure of *argument size* and  $f(x)$  only makes recursive calls of form  $f(y)$  with  $\text{size}(y) = \text{size}(x) - 1$

# Example

```
fun eval ([ ]:int list) : int = 0  
| eval (d::L) = d + 10 * (eval L);
```

(size = length of argument list,  
decreases by 1 in recursive call)

To prove:

For all values L:int list  
there is an integer n such that  
 $\text{eval } L \Rightarrow^* n$

# Exercise

- Prove the termination property for `eval`
- It's easy using simple induction on the length of the argument list

# When it doesn't work

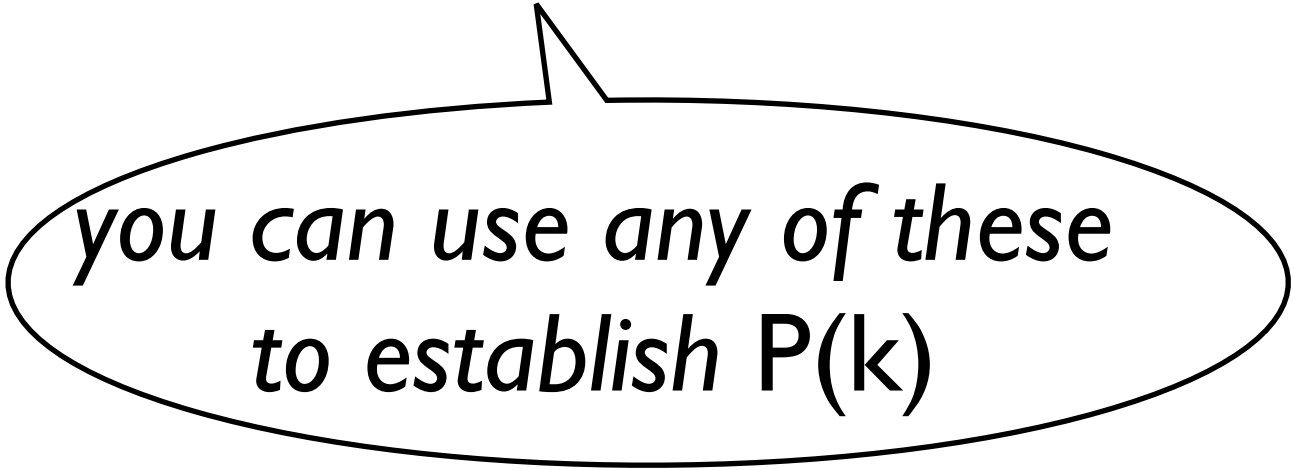

You cannot use  
**simple** induction  
for

```
fun decimal (n:int) : int list =  
  if n < 10 then [n]  
    else (n mod 10) :: decimal (n div 10)
```

Why not?

# Strong induction

- To prove a property of the form  
 $P(n)$ , for all non-negative integers  $n$
- Show that, for all  $k \geq 0$ ,  $P(k)$  follows logically from  $\{P(0), \dots, P(k-1)\}$ .

*you can use any of these  
to establish  $P(k)$*

# Why it works

- $P(0)$  gets a direct proof      WHY?
- $P(1)$  follows from  $P(0)$
- $P(2)$  follows from  $P(0), P(1)$
- $P(3)$  follows from  $P(0), P(1), P(2)$
- For  $k > 0$  at the  $k^{\text{th}}$  step we've already shown  $P(0), \dots, P(k-1)$ , and  $P(k)$  follows

# Using strong induction

- Q: When can I use *strong* induction to prove a property of a recursive function  $f$  ?
- A: When there is a *non-negative* measure of *argument size* and  $f(x)$  only makes recursive calls of form  $f(y)$  with  $\text{size}(y) < \text{size}(x)$

# Example

```
fun decimal (n:int) : int list =  
  if n < 10 then [n]  
    else (n mod 10) :: decimal (n div 10);
```

(when  $n \geq 10$ ,  $0 \leq n \text{ div } 10 < n$ )

To prove:

For all values  $n:\text{int}$  such that  $n \geq 0$ ,  
 $\text{eval}(\text{decimal } n) = n$

# Proof by strong induction

- For  $0 \leq n < 10$ , show directly that  $\text{eval}(\text{decimal } n) = n$
- For  $n \geq 10$ , assume that  
For each  $m$  such that  $0 \leq m < n$ ,  
 $\text{eval}(\text{decimal } m) = m$

Show that  $\text{eval}(\text{decimal } n) = n$

# Proof sketch

- For  $n \geq 10$  let  $r = n \bmod 10$ ,  $q = n \operatorname{div} 10$ .  
 $\text{eval}(\text{decimal } n)$   
 $= \text{eval } ((n \bmod 10) :: \text{decimal}(n \operatorname{div} 10))$   
 $= \text{eval } (r :: \text{decimal } q)$
- Since  $0 \leq q < n$  it follows from IH that  
 $\text{eval}(\text{decimal } q) = q$
- Hence there is a list value  $Q$  such that  
 $\text{decimal}(q) = Q$

$$\begin{aligned}\text{And } \text{eval } (r :: \text{decimal } q) &= \text{eval } (r :: Q) \\ &= r + 10 * \text{eval}(Q) \\ &= r + 10 * q = n\end{aligned}$$

# Notes

- We proved that for all values  $n \geq 0$ ,  $\text{eval}(\text{decimal } n)$  *evaluates* to  $n$
- It follows that for all expressions  $e:\text{int}$ , if  $e \Rightarrow^* n$  and  $n \geq 0$ , then  $\text{eval}(\text{decimal } e) \Rightarrow^* n$
- Also possible to use induction based on *evaluational* reasoning to prove these results
